---- DART OOP ----

- 1) **(Encapsulation)** : Write a class named **BankAccount** with one private property **_balance**. There is one getter **balance** to read the value of the property. There are methods **deposit** (ابداع) and **withdraw** (سحب) to update the value of the **_balance**.

```
Enter amount of deposite : 1000
Balance after deposit: 1000
```

```
Enter amount of withdraw : 500
Balance after withdraw: 500
```

- 2) Create a **Rectangle** class with **width**, **height** and add a method **getArea()** that returns the area. Print the area of the rectangle.
